Experiment -1

AIM:

1. Create an IAM user with programmatic access only, download the access key and secret key, and document the steps with screenshots.Then set up a billing alert for the account so that an email is received when the Free Tier limit is about to be crossed.

Description:

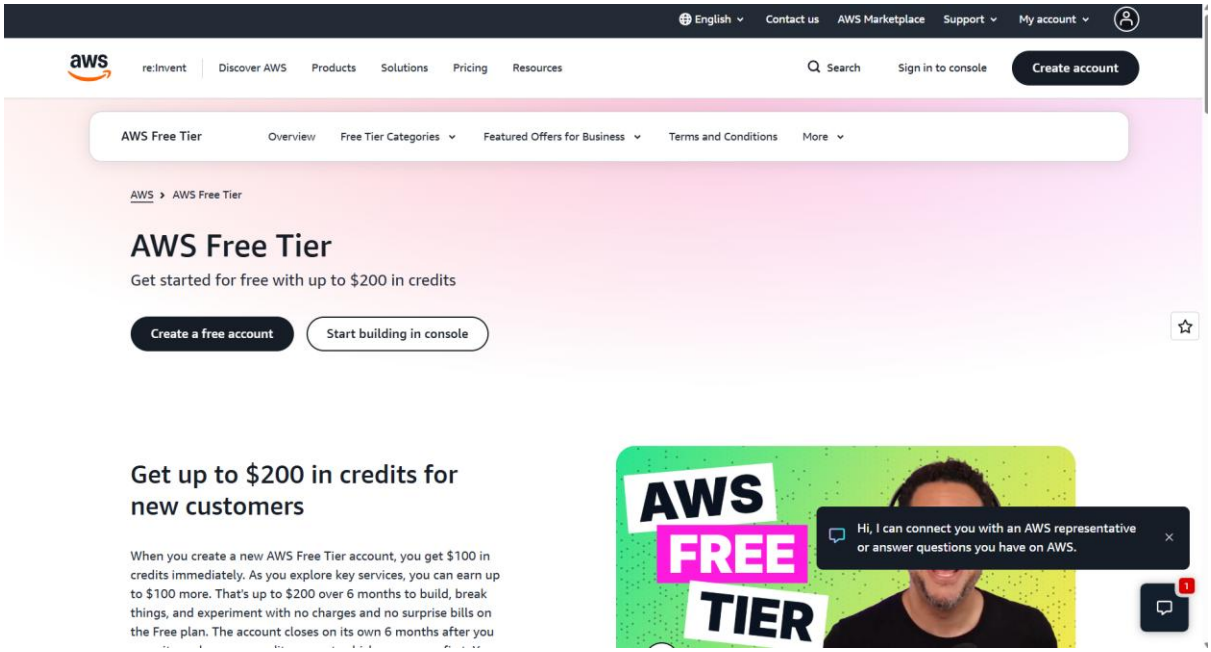

In this experiment, an IAM user was created in AWS with programmatic access only. The Access Key ID and Secret Access Key were generated and downloaded for secure authentication. The process was documented with screenshots.

A billing alert was configured in AWS Billing and Cost Management by creating a budget and adding an email recipient. This helps monitor AWS Free Tier usage and receive email notifications when usage approaches the configured budget threshold, helping to avoid unexpected charges.

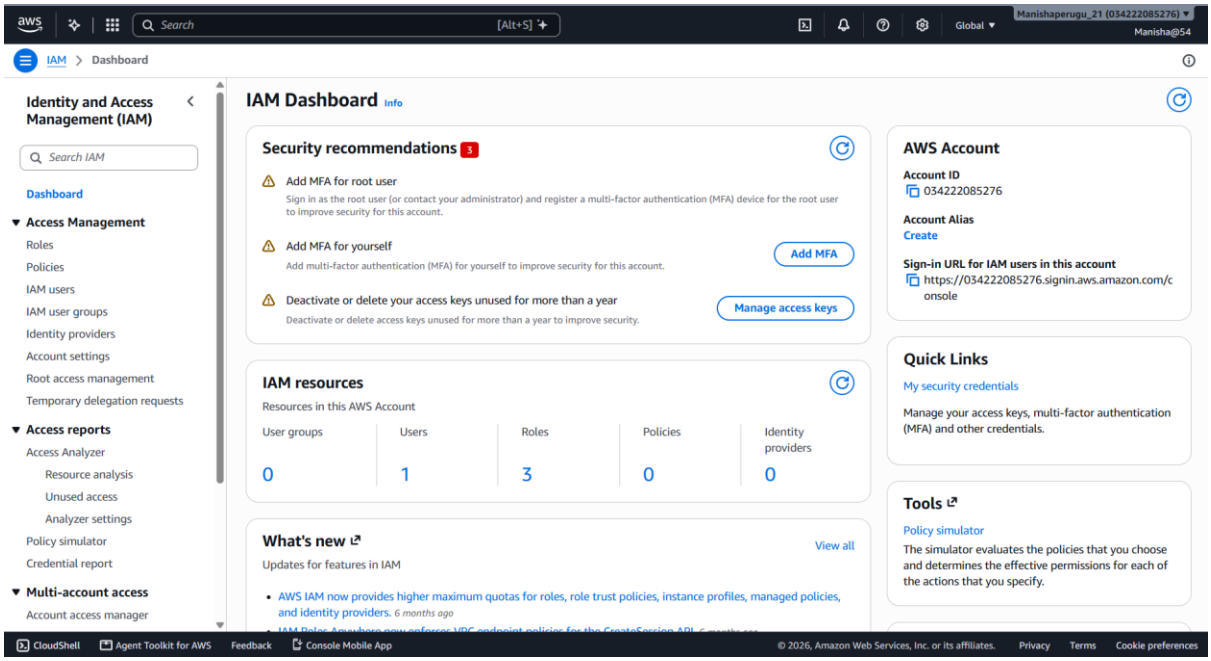

Steps:

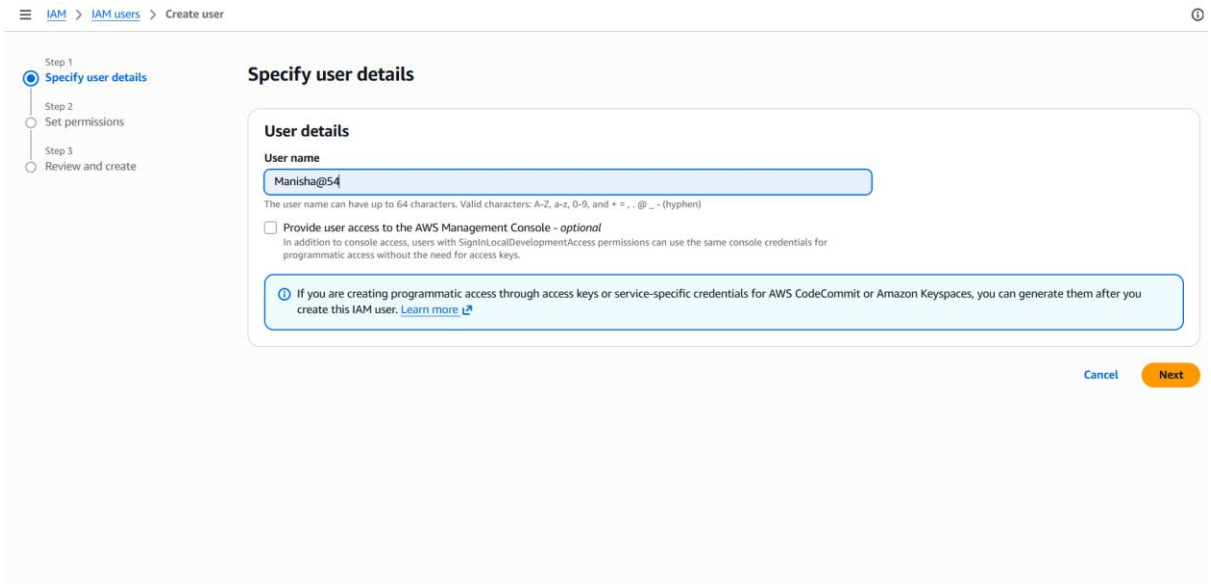

1. Open the AWS Management Console and navigate to IAM (Identity and Access Management).
2. Select Users, choose Create user, and enter a user name.
3. Configure permissions by attaching the required policy, then review and create the IAM user.
4. Open the created user and go to Security credentials. Create an access key for command-line/programmatic use.
5. Download and securely store the Access Key ID and Secret Access Key. Do not share these credentials.
6. Open Billing and Cost Management, select Budgets, and choose Create budget.
7. Enter a budget name and email recipient, configure the budget threshold, and create the budget to receive email alerts.

Output:

The IAM user was created successfully with programmatic access, and the access credentials were downloaded. The AWS budget was created with an email notification recipient to monitor usage and alert when the configured threshold is reached.
